

API documentation

Unimus REST API

Since version 1.5.0, Unimus offers an API for integration with 3rd party applications.

The Unimus API is a JSON based RESTfull API. It utilizes common HTTP methods such as **GET**, **POST**, **PATCH** and **DELETE** in order to identify actions you want to perform.

If you want to see the full API documentation, it's available here:

APIv3: [Full APIv3 docs](#)

APIv2: [Full APIv2 docs](#)

APIv1: [Full APIv1 docs](#)

We also have **curl** examples for APIv2, which you can use for fast integration here:

[APIv2 curl examples](#)

For APIv3, **curl** examples are offered directly by the Swagger docs:

Execute

Clear

Responses

Curl

```
curl -X 'GET' \
  "https://your-unimus-address:8085/api/v3/zones?page=0&size=2147483647" \
  -H 'accept: application/json' \
  -H 'Authorization: Bearer api-token-here'
```

Request URL

```
https://your-unimus-address:8085/api/v3/zones?page=0&size=2147483647
```

Server response

Code	Details
