

# Schedules running at wrong time & timezone issues

If your schedules are running at a wrong time (configured as time **X**, but running at a different time), the issue is most likely in the timezone settings of the OS.

Unimus uses the timezone settings from the host operating system.

The correct timezone needs to be set in 2 places in Linux. You can check using:

```
cat /etc/timezone  
timedatectl
```

Both outputs should show correct timezone.

If one (or both) are not correct, here is how to fix this:

```
# these commands are for Debian distributions, please adjust as needed  
# please substitute your actual TZ in the echo command  
  
systemctl stop unimus  
echo "Europe/Rome" | sudo tee /etc/timezone  
sudo dpkg-reconfigure --frontend noninteractive tzdata  
systemctl start unimus
```
