

Running Windows Portable

Download Unimus

Unimus for Windows is available in 2 versions:

- Standard installer
- Portable (standalone)

Download link:

<https://unimus.net/download.html>

For information on installing Unimus, please [see this wiki article](#).

Portable

You can run Unimus in portable (standalone) mode - you simply launch it, and it runs.
This means there is nothing to install, and Unimus will only run when you launch it yourself.

Install Java

Before running Unimus portable, you will need to install Java.
Unimus is written in Java, and requires a JRE (Java Runtime Environment) to run.
We support Java 8-11, and you can use Oracle, OpenJDK or Corretto JRE.

After installing Java, Java may launch your browser and attempt a browser plugin test - you can safely ignore this.
Unimus does **not** use Java in the browser (Unimus is **not** an Applet), so this functionality is not required.

Run Unimus Portable

To run Unimus in portable (standalone) mode, simply launch the Unimus.exe.

This will open Unimus in a command-line window.
As long as this window remains open, Unimus will stay running.

You can close Unimus simply by closing the command-line window (or use Ctrl+C).

Start using Unimus

Unimus will now run at <http://localhost:8085>, you can access it using your browser.
(substitute 'localhost' for the address of your Unimus server)

If this is the first time you run Unimus, we recommend checking out the [initial configuration guide here](#).
