Running in Docker - Core

We recommend using a Docker image from:
https://hub.docker.com/r/croc/unimus-core

Please see the instructions available on the GitHub page for more info:
https://github.com/crocandr/docker-unimus-core

You will need to configure Unimus connection information in the **docker-compose** file as described in the GitHub documentation. After the container starts, you should see your Core online in Unimus.
