

Installing on Ubuntu / Debian - Core

Running the installer

Run the installer to install Unimus Core on your system:

```
apt-get install wget curl -y
wget https://unimus.net/install-unimus-core.sh
chmod +x install-unimus-core.sh
./install-unimus-core.sh
```

Security note: it is dangerous running unknown scripts from the internet.

The installer sources can be found in our [GitHub repo](#), please review the script sources before running on your machines.

The installer will ask for all required information to configure the Core.

After the installer finishes and the Core service starts, you should see your Core online in Unimus.
