Configuration wizard

The Deployment Wizard

The Deployment Wizard is the first set of screens you will see when you deploy a new Unimus instance.
The Wizard is a simple step-by-step process and serves as a help system to set up a clean Unimus instance to a fully usable state.

How to use the Wizard

The configuration wizard offers help and explanations in the left help-bar on each page.
Please refer to these help segments, they should provide all the information you need to successfully complete the Wizard.

Alternatively, we also have a video that can help you complete the wizard.

First time connection issues

When you connect to Unimus over its web interface for the first time, you should automatically be redirected to the Deploy Wizard.
If you see an error during startup, or you can not connect to the Unimus UI, please use our Common first-launch issues page to get help.

All steps of the Deploy Wizard

Welcome to Unimus !

We see this is the first time you are using Unimus, welcome! To help you configure Unimus, please complete this Quick setup.

If you want to run this setup in the future any time, simply launch from 'Configuration > Quick setup'

Please configure your username and password.

You will use this the next time you access Unimus to log in.

Continue setup

Configure the database

You can configure the database connection here.

If you don't want to deal with a database setup (or don't know how to setup a database), don't worry. You can just fill in the encryption key and click 'Continue setup' and the default settings will work just fine.

The encryption key will be used to encrypt sensitive data in the database using AES128. Please make sure to store it securely, as it will be required if you are migrating the database or Unimus server.

If you are adding more than 100 device into Unimus, we do however recommend using an external database.

Database config

Database type
Mysql

Continue setup

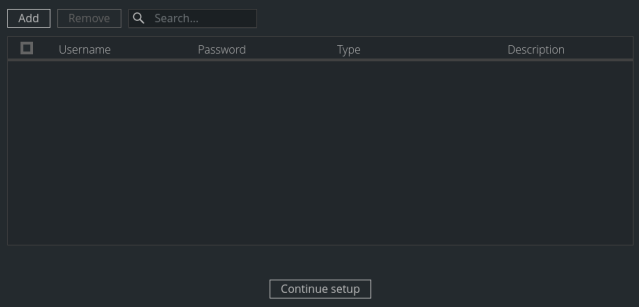

Network credentials configuration

Please configure the network credentials used to access the devices in your network. Unimus will use these credentials to log in to your devices to backup their configuration.

During device discovery, Unimus will try each of these credentials to log in to the device, to find the valid credentials for that particular device.

This configuration can be access at any time from the 'Configuration > Network credentials' menu after completing this setup.

Add credentials used in your network

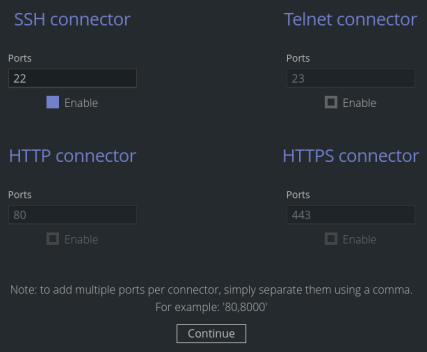

Backup connector configuration

Here you can configure what ports each of the backup connectors use. You should change this if the devices in your network use non-standard ports to expose the services listed on this page.

If you don't understand what the things listed on this page are (or are not using non-standard ports on your devices) you can just continue, we have already pre-set the usual defaults for you!

This configuration can be access at any time from the 'Configuration > Connectors' menu after completing this setup.

Configure ports used in your network

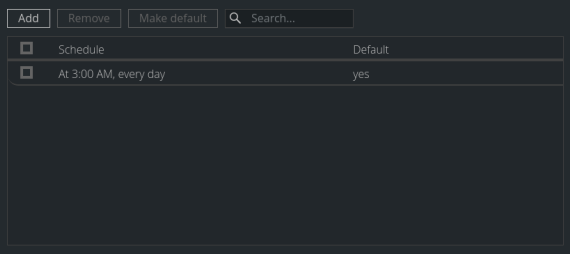

Backup schedule configuration

Unimus backs up your devices according to schedules. Each device can have a different schedule assigned, or use the default, system-wide schedule. You can add schedules here, and mark one of them as the default schedule.

We have already configured a schedule for 3am every night and marked it as the default schedule. If you're happy with this, simply continue the setup!

This configuration can be access at any time from the 'Configuration > Schedules' menu after completing this setup.

Configure backup schedules

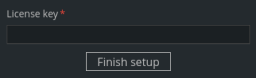

Continue setup

Final step - provide your license key

Unimus requires a license key to run. Your license key will allow you to manage a certain number of devices.

You can get a free license key from portal.unimus.net.

Enter your license key

Finish setup
