

Import

Unimus supports 3 main ways to bulk-add / import devices.

- Basic import
 - One-time import, based on user interaction.
- Network scan
 - Can identify devices in the network with an option to add newly found devices to Unimus automatically.
 - Scan has an option for one time use, but can be also scheduled to run periodically.
- NMS sync
 - Allows Unimus to automatically import devices from an NMS according to a Sync Preset configuration.
 - This gives you the ability to synchronize inventory from your NMS / DCIM system to Unimus.
 - Can be triggered manually or on a periodic basis according to a configured schedule.

You can find more information on each Importer below:
